

## STUDY GUIDE

# CORRELATION AND COVARIANCE

---

## Key Terms

**Relationship:** When one variable may be influencing another. We can never use the word "cause" in statistics.

## Cheat Sheet

### 1. Correlation and Covariance

	<b>Correlation Coefficient</b>	<b>Coefficient of Determination</b>	<b>Covariance</b>
<b>Designation</b>	$r$	$r^2$	$COV(X,Y)$
<b>Possible Values</b>	-1 to 1	0 to 1	$-\infty$ to $+\infty$
<b>Description</b>	The strength and direction of a relationship	How much of the variance in y can be explained by the X variable	How the variables "move" together
<b>Excel Function</b>	CORREL()	Square the result of CORREL()	COVARIANCE.P() or COVARIANCE.S()

### 2. Understanding Scatterplots

- » Scatterplots are a great way to visualize the relationship between two quantitative variables.
- » There are few patterns you can spot within a scatterplot. These patterns are described in terms of:
  - » **Linearity:** Whether a data pattern is linear (straight) or nonlinear (curved).

**Linear**

**Nonlinear**

- » **Slope:** The direction of change in variable Y when variable X increases. If variable Y also increases, then the slope is positive; but if variable Y decreases, the slope is negative.

**Positive Slope**

**No Slope**

**Negative Slope**

- » **Strength:** The degree of "scatter" in the plot. If the dots are widely spread, the relationship between variables is weak. If the dots are concentrated around a line, the relationship is strong.

**Strong**

**Weak**
